

# PALLY™

## CASE STUDY

### PMS DIECASTING:

*“how did we manage without them?”*

Prior to launching the Pally system (a fully integrated pallet and dolly unit), Loadhog approached PMS Die-casting to understand how the product could benefit industrial manufacturing operations.

PMS immediately saw the value in the product for both internal operations and for their clients, rolling the system out to a major UK customer within one week.

Allan Follows, General Manager of PMS Die-casting, commented, *“they are proving to be extremely useful, I have started to wonder, how did we manage without them? Wooden pallets, pump trucks and stretch wrap all seem very crude now.”*

### What is the Pally?

The Pally is a Half Euro sized (800x600mm) pallet and dolly combination. In pallet form the Pally acts as a stable and immovable 800 x 600mm pallet, with one pedal push at either end, the Pally, with its load of up to 500kg, is transformed into a movable wheeled dolly unit and vice versa.

PMS pack zinc die-castings for their clients into 400x300mm plastic trays. Previously stacked onto standard wooden pallets and wrapped/banded for security, the move to Pally has given PMS the flexibility to use a stable pallet where needed, yet move a fully loaded unit around production processes, between sites and on/off transportation vehicles on demand and without the need for any forklift/pump truck equipment.

### A completely integrated, secure and waste free system:

PMS use the Pally in conjunction with the Loadhog self securing pallet lid to provide a completely sustainable system – eliminating the need for any disposable securing materials or equipment, driving additional labour savings and improving product security.

### The result?

The Pally & Lid system has reduced labour/process time for PMS, created valuable space savings in busy operating environments, eliminated pallet instability issues and reduced the requirement for pump truck and forklift movements.

Once at the customers operations, the heavy product can be simply wheeled off the trailers, direct to the factory floor for final assembly or further processing.
